Features interview with John

**Here's an excerpt from that interview:

In November 2009, Amos gained some notoriety in oil and gas circles when he testified before a Senate panel about a serious oil well accident off the coast of Australia. Sitting between two oil industry executives in the hearing room, Amos warned that a similar blowout could happen in the United States.

His comments were soundly criticized by Sen. Mary Landrieu (D-La.), who insisted that the benefits of oil development in the Gulf far outweigh the risks. Pointing at a satellite image of the massive Australian oil accident, Landrieu added: "The fact is, these things happen."

Five months later, BP PLC's Deepwater Horizon oil rig exploded in the Gulf of Mexico, killing 11 workers and spilling 5 million barrels of oil into U.S. waters. In the early days of the disaster, SkyTruth was among the only sources of satellite images of the spill.

"That experience made me think we really need independent, credible watchdogs looking out over industries like this," he said. "So I see a strong continuing role not just for SkyTruth, but for people all over engaged in skytruthing.

"That's what we're working toward -- making the data and tools we use available for free so that other people can actively monitor what's going on in the places they care about."
